

Source eNodeB Interfaces (Successful Handover)				
LTE Mobile	eNodeB Network		Core Network	EventStudio System Designer 6 20-Apr-13 22:03 (Page 1)
UE	Target eNodeB	Source eNodeB	SGW	

This sequence diagram was generated with EventStudio System Designer - <http://www.EventHelix.com/EventStudio/>

eNodeBs in LTE are interconnected with the X2 interface. If two eNodeBs are served by the same MME, handover from the source to the target eNodeB will take place over the X2 interface.

The UE and Source eNodeB are in RRC Connected state.

The network sets the measurement thresholds for sending measurement reports.

Neighboring cell signal quality is now better than the serving cell.

The RRC uses the latest measurement to decide if a handover is needed to another cell. The target cell is selected. The eNodeB for the target cell is identified.

The Source eNodeB initiates the handover with the Handover Request message. Information about active E-RABs, security keys is included in the message. (Click on the message name above the arrow to see message details)

Source eNodeB Interfaces (Successful Handover)

X2AP Handover Request Acknowledge

The Target eNodeB responds back to the source eNodeB with a Handover Request Acknowledge message. This message carries the Handover Command message (RRC Connection Reconfiguration Request) in a transparent container. (Click on the message name above the arrow to see message details)

X2 Bearer Establishment

An X2 GTP connection is established between the Source and the Target eNodeBs. This channel will carry the user data during the handover.

Handover execution

RRC Connection Reconfiguration Request

The Source eNodeB sends a handover command to the UE. The message contains a new C-RNTI and new DRB IDs. A RACH preamble is also included for contention free RACH access.

X2AP SN Transfer Status

The PDCP sequence numbers are sent from the source to the target eNodeB. (Click on the message name above the arrow to see message details)

Downlink data flow during handover preparation

At this point all downlink data is getting rerouted from the source eNodeB to the target eNode. The data is being buffered at the target as the UE is yet to connect to the target.

Uplink data flow during handover preparation

The uplink data is still being sent from the UE to the SGW via the Source eNodeB.

At this point, the UE has detached from the source eNodeB but is still not communicating with the target eNodeB. The UE is in the RRC-Idle state.

The UE is now connected to the target eNodeB. All the queued messages are now transmitted towards the UE.

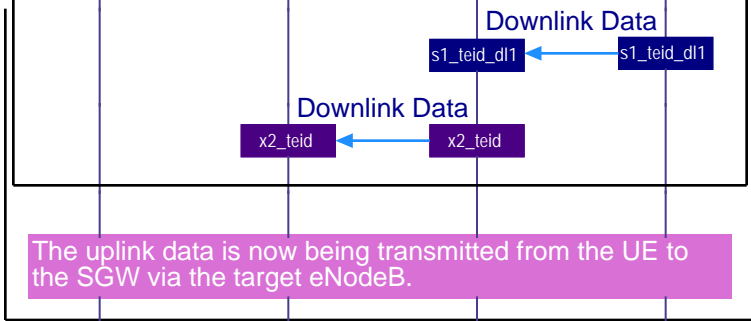

Downlink data flow during handover execution

During handover execution the data being routed from the SGW to the UE via the source and the target eNodeBs.

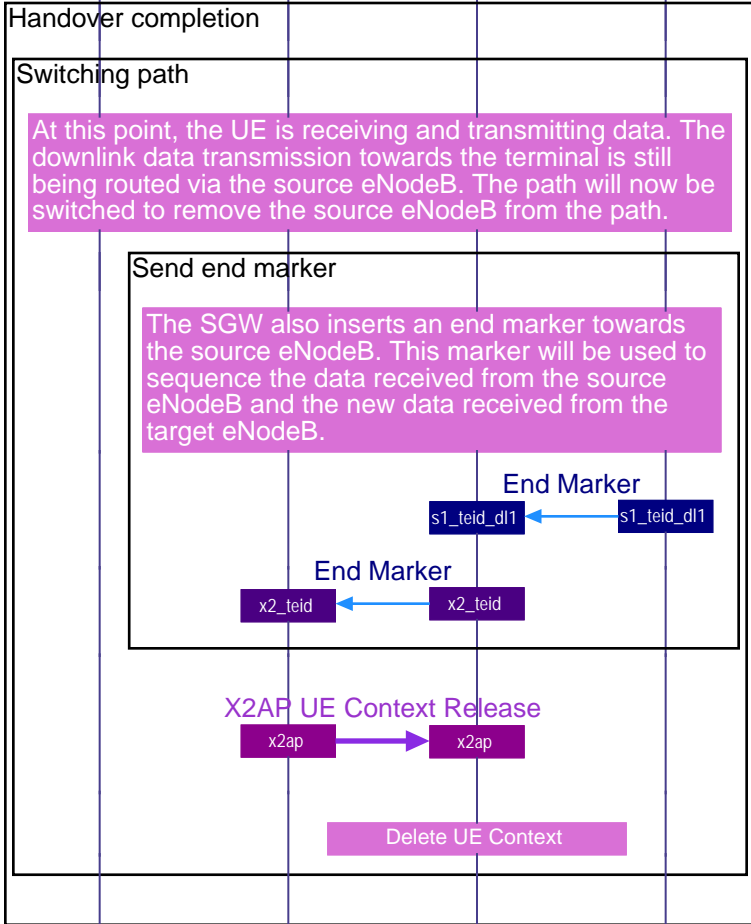

Source eNodeB Interfaces (Successful Handover)

LTE Mobile	eNodeB Network		Core Network	EventStudio System Designer 6
UE	Target eNodeB	Source eNodeB	SGW	

20-Apr-13 22:03 (Page 3)

The uplink data is now being transmitted from the UE to the SGW via the target eNodeB.

The end marker has been received at the Target eNodeB. At this point the target asks the source eNodeB to release resources for the UE. (Click on the message name above the arrow to see message details)
