This scenario describes the call setup for a GSM originating call. A mobile user calling a land line subscriber is covered here.

Begin RR Connection Establishment					
Call related information needs to be transported from the mobile phone to the Mobile Switching Center (MSC). This requires the establishment of a Radio Resource (RR) connection to MSC. The first phase of the call setup just sets up this RR connection.					
	RR CHANNEL REQUEST	•			RR connection establishment is triggered by sending the Channel Request message. This message requests the Base Station System (BSS) for allocation for radio resources for the RR connection setup. The mobile now waits for an assignment on the Access Grant Channel (AGCH). At this point the mobile is listening to the AGCH for a reply.
Note: The RR CHANNEL REQUEST is sent on a Random Access Channel (RACH). This is a slotted aloha channel that can be used at random, without any coordination between the mobiles. Any mobile can transmit on this channel whenever it wishes. If two mobiles transmit on the channel at the same time, their messages will be lost in a collision. The mobiles will detect the collision via a timeout and retransmit the message after a random back off.					
	IMMEDIATE ASSIGNMI Resource = (TCH, Frequency, Correction, Frequency Correction	-			The BSS transmits the radio resource assignment to the Mobile via the AGCH channel. The message also contains the time and frequency corrections. The time corrections allow the mobile to time it's transmissions so that they reach the BSS only in the specified slot. The frequency corrections correct for the Doppler shift caused by the mobile's motion.
RR SAE	M + MM CM SERVICE R TCH, SAPI = 0 RR UA	EQUEST			This is the first message that is sent after tuning to the channel. The Mobile initiates a LAPm connection with the BSC by sending a Set Asynchronous Balanced Mode (SABM) message. The service request message meant for the MSC is also sent in this message. The BSS replies with Unnumbered Acknowledge (UA) to complete
	TCH, SAPI = 0				the LAPm setup handshake
Enable Cinb	ring				LEG: Skip Authentication Procedure
Enable Ciphe	Ŭ				The DSS counds the CIDUSEDING MODE COMMAND to the media
RRU	mode = CLEAR				The BSS sends the CIPHERING MODE COMMAND to the mobile. The mobile will be able to receive this message as the transmission from the BSS is still in clear.
RR (mode = CIPHERED	LETE			Ciphering has already been enabled, so this message is transmitted with ciphering. The BSS will receive this message as it is already expecting ciphered data in the receive direction.
RR Connection Establishment Completed					
At this point a connection has been setup between the Mobile and the MSC. From this point onward, the BSS is just acting as a conduit for transporting the signaling messages between the Mobile and the MSC.					
Call Setup					
	CC SETUP Dialed Digits				The Mobile sends the setup message to establish a voice call. The message contains the dialed digits and other information needed for call establishment.
	CC CALL PROCEEDING	_			The mobile is informed that the call setup is in progress.
Mode Modif	V				
· · · ·	CHANNEL MODE MOD	IFY			The BSS notifies the Mobile about the changeover to voice mode.
RR CHANN	EL MODE MODIFY ACK	OWLEDGE			Mobile acknowledges.
	ISU	INITIAL ADD SS7, Diale		SAGE	The MSC routes the call and sends the call towards the called subscriber
	ISUP	ADDRESS CON SS ⁷ , Diale	/PLETE ME	SSAGE	The PSTN indicates to the MSC that it has received all the digits and the called subscriber is being rung.
